DETAILED ACTION

Response to Amendment

1. The amendment(s), filed on 06/25/2007, have been entered and made of record. Claims 1-16 are pending.

Response to Arguments

2. Applicant's arguments filed 06/25/2007 have been fully considered but they are not persuasive because the arguments regarding claim 1 are most based on the 112 Rejection discussed below. Accordingly, the Examiner maintains the rejections to claims 1-16.

Claim Objections

3. Claims 1-16 are objected to because of the following informalities: The Applicant has amended the photosensitive cell limitation to be "relatively high photosensitive cell" and "relatively low photosensitive cell" instead of "main photosensitive cell" and "auxiliary photosensitive cell", respectively. However, amendments to these limitations have not been provided for other the respectively limitations in *claims 1, 8, 15, and 16*. Appropriate correction is required.

Claim Rejections - 35 USC § 112

4. Claims 1-16 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.

5. The terms "relatively high" and "relatively low" in claim 1 is a relative term which renders the claim indefinite. The terms "relatively high" and "relatively low" is not defined by the claim, the specification does not provide a standard for ascertaining the requisite degree, and one of ordinary skill in the art would not be reasonably apprised of the scope of the invention. The limitations regarding [a/the] photosensitive cell has been rendered indefinite by the use of the terms "relatively high" and "relatively low".

For the prior art rejections, the Examiner will provide the best interpretation of the claims as possible due to the 112 Rejection as discussed above.

Claim Rejections - 35 USC § 103

- 6. The text of those sections of Title 35, U.S. Code not included in this action can be found in a prior Office action.
- 7. Claims 1-4, 8-11, and 15-16 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yamashita et al. (U.S.#6,750,437) in view of Suzuki et al. (U.S. Pat. #4,710,803), and Nakano et al. (U.S.#6,094,220).

As for claim 1, Yamashita teaches a method of controlling a solid-state image pickup apparatus (first embodiment, figs. 2-3 and 7), comprising:

a preparing step of preparing a solid-state image pickup apparatus configured to process and output an image signal output from a solid-state image sensor that converts an optical image representative of a field and focused on said solid-state image sensor by a lens to the image signal (col. 7, lines 4-6 and 49 – col. 8, line 11), said solid-state image sensor including a plurality of composite pixels (fig. 2, refs. 309) which are arranged in a photosensitive array (col.

Application/Control Number: 10/754,498

Art Unit: 2622

Page 4

3, lines 38-50) and each of which includes of a relatively high photosensitive cell (figs. 2/3, ref. 301), having a first area, (col. 4, lines 41-50) and an relatively low photosensitive cell (figs. 2/3, ref. 302) of a same color (inherently) as the relatively high photosensitive cell (col. 3, lines 51-58; col. 4, lines 4-11), the relatively low photosensitive cell, having a second area (col. 4, lines 57-62) [the auxiliary photosensitive cell inherently has the same color as the main photosensitive cell because Yamashita teaches that *a color filter* is provided for each of the pixels and a pixel corresponds to a point indicating *a color*. Please read col. 2, lines 51-58 and col. 4, lines 4-11], the auxiliary photosensitive cell different in sensitivity (different viewpoints) from each other and respectively formed by main photosensitive portion and an auxiliary photosensitive portion (col. 3, lines 38-50; col. 7, line 49 – col. 8, line 11),

Yamashita also discloses a plurality of microlenses (fig. 3) respectively positioned in said plurality of composite pixels focusing incident light (col. 3, lines 51-58), and only a single color component filter segment positioned in each of said plurality composite pixels (col. 3, lines 51-58), a plurality of color component filter segments being provided in a preselected (indicating) color component filter pattern (col. 4, lines 4-11);

a photometry step of executing photometry with the field (col. 7, lines 49-52);

a signal processing step of processing the image signal and (col. 8, lines 2-11);

a control step of switching signal processing of said signal processing step in accordance with a result of photometry executed said photometry step (col. 7, line 49 – col. 8, line 11);

wherein said control step includes estimating influence of shading on the image signals from the relatively high photosensitive cell and the relatively low photosensitive cell (col. 12, line 60 - col. 13, line 2), and

Yamashita does not expressly disclose the auxiliary photosensitive cell having a second area smaller than the first area, wherein, in the signal processing step, color difference gain processing for the image signal being switched in accordance with control of said control step to thereby lower a chroma of the image signal.

In a similar field of endeavor, Suzuki discloses a solid-state image sensor (fig. 3, ref. 10) including a plurality of composite pixels (figs. 3 and 4, ref. 10a) which are arranged in a photosensitive array and each of which includes a main photosensitive cell (fig. 4, refs. 28, 34, and 35), inherently having a first area, and an auxiliary photosensitive cell (fig. 4, ref. 29). inherently having a second area smaller than the first area (col. 3, lines 35-67). In light of the teachings of Suzuki, it would have been obvious to one of ordinary skill in the art at the time the invention was made to include a main photosensitive cell, having a first area, and an auxiliary photosensitive cell, having a second area smaller than the first area in the method of Yamashita. This modification improves the signal to noise ratio of the image signal as well as the dynamic range (Suzuki, col. 1, lines 30-34).

In a similar field of endeavor, Nakano et al. has a solid-state image pickup apparatus called an image pickup unit comprising a solid-state image sensor called an image pickup element (fig. 1, ref. 11), which converts light having passed a lens block into an electrical signal (col. 2, lines 19-23). Nakano's lens block performs automatic focus control, automatic iris control, and zoom control on the image signal (col. 2, lines 18-23), where the signal from the image sensor executes photometry (fig. 1, col. 2, lines 12-17). In addition, Nakano discloses a signal processor (fig. 1, ref. 11) and an image extraction unit (fig. 1, ref. 14) for processing the image signal and a controller (fig. 1, ref. 13) for switching signal processing the signal processor

in accordance with components of the lens block and with a result of photometry (col. 2, lines 22-35). Lastly, in the image extraction unit, the image signal undergoes color difference gain processing (col. 2, lines 35-40) wherein the image signal is switched in accordance with a microcomputer (fig. 1, ref. 131) of the controller, which will lower a chroma of the image signal (col. 4, lines 22-30). In light of the teachings of Nakano, it would have been obvious to one of ordinary skill in the art at the time the invention was made to combine Nakano's method of signal processing with Yamashita's solid-state image sensor in order to extract an object on the standardized color difference plane with high accuracy due to a change of distribution of the object on the standardized color difference plane (Nakano, col. 1, lines 29-33).

For **claim 2**, Yamashita, as modified by Suzuki and Nakano, teaches the method wherein a control step variably controls the signal processing for the image signal in accordance with a focal distance of the lens. Please read Yamashita, col. 7, line 49 – col. 8, line 11; and Nakano, col. 2, lines 12-23.

For **claim 3**, Yamashita, as modified by Suzuki and Nakano, teaches the method wherein a control step variably controls the signal processing for the image signal in accordance with a zoom position of the lens (Nakano, col. 2, lines 18-23).

For **claim 4**, Yamashita, as modified by Suzuki and Nakano, discloses the method wherein said signal-processing step that further includes tone correction processing for the image signal switched in accordance with the control of the control step. Nakano's image pick up apparatus has a signal processor (fig. 1, ref. 11) and an image extraction unit (fig. 1, ref. 14) for processing the image signal wherein the image extraction unit allows a condition to set under the desired hue and degree of color saturation (col. 4, lines 14-21). The tonality correction provides

Application/Control Number: 10/754,498

Art Unit: 2622

Page 7

an additional improvement for quality of the color image by controlling the white balance (Nakano, col. 1, lines 48-52). Also please read Yamashita, col. 7, line 49 – col. 8, line 11.

Claims 8-11 are apparatus claim corresponding to the method claims 1-4. Therefore, claims 8-11 are analyzed and rejected as previously discussed with respect to claims 1-4.

For **claim 15**, Yamashita, as modified by Suzuki and Nakano, teaches a method, wherein the main photosensitive cell has a region provided obliquely with regard to a horizontal direction, and the auxiliary photosensitive cell is provided in a space defined by the region (Suzuki; figs. 3 and 4; col. 3, lines 35-67).

Claim 16 is an apparatus claim corresponding to the method claim 15. Therefore, claim 16 is analyzed and rejected as previously discussed with respect to claim 15.

8. Claims 5 and 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yamashita et al. (U.S.#6,750,437) in view of Suzuki et al. (U.S. Pat. #4,710,803) and Nakano et al. (U.S.#6,094,220) as applied to claims 4 and 11, respectively above, and further in view of Nakata et al. (U.S.#6,747,696).

For **claim 5**, Yamashita, as modified by Suzuki and Nakano, discloses the method wherein said signal-processing step (Yamashita, col. 7, line 49 – col. 8, line 11). Nakano has a signal processor that is switched in accordance with the controller (fig. 1; col. 2, lines 22-35). However, Yamashita nor Nakano and Suzuki do not expressly teach a method wherein in said signal-processing step a gamma table to use is switched in accordance with the control of the control step.

In a similar field of endeavor, Nakata has a solid-state image apparatus that is configured to process image signals. This includes a gamma correction table (fig. 7 or fig. 8) switched by a control signal (col. 13, lines 29-43 or col. 14, lines 6-26). In light of the teachings of Nakata, it would have been obvious to one of ordinary skill in the art at the time the invention was made for Yamashita, as modified by Suzuki and Nakano, to include a signal-processing step with a gamma table switched by a controller. This modification provides a means for carrying out a correcting processing for canceling noise component from image data without deteriorating image quality so as to obtain excellent image data (Nakata, col. 1, lines 66-67 and col. 2, lines 1-3).

Claim 12 is an apparatus claim corresponding to the method claim 5. Therefore, claim 12 is analyzed and rejected as previously discussed with respect to claim 5.

9. Claims 6-7 and 13-14 are rejected under 35 U.S.C. 103(a) as being unpatentable over Yamashita et al. (U.S.#6,750,437) in view of Suzuki et al. (U.S. Pat. #4,710,803) and Nakano et al. (U.S.#6,094,220) as applied to claims 1 and 8, respectively above, and further in view of Ng et al. (U.S.#5,699,102).

For claim 6, Yamashita, as modified by Suzuki and Nakano, teaches the method wherein photometry (Yamashita, col. 7, line 49 – col. 8, line 11). However, Yamashita nor Nakano and Suzuki do not expressly teach a method wherein said control step determines the shading on the basis of the result of photometry and switches the processing of said signal processing step in accordance with a result of determination. In figure 1 and 2, Ng has an imaging device with a controller that compensates the shading on the basis of the photometry result along with a

gain/filter corrector (col. 2, lines 47-49; col. 3, lines 1-11). In light of the teaching of Ng, it would have been obvious to one of ordinary skill in the art at the time the invention was made for Yamashita, as modified by Suzuki and Nakano, to include the control step of Ng in order to standardize the image signals and thus improve the quality of the image (col. 2, lines 61-67).

For claim 7, Yamashita, as modified by Suzuki, Nakano, and Ng, teaches wherein said photometry step that executes (Yamashita, col. 7, line 49 - col. 8, line 11) divisional photometry with the field on the basis of the image signal output from the image sensor, and wherein said control step determines shading on the basis of a result of said divisional photometry. In the Ng patent, please see figure 2 and read col. 2, lines 61-67. Including the photometry step standardizes the image signals and thus improves the quality of the image.

Claims 13-14 are apparatus claims corresponding to the method claims 6-7. Therefore, claims 13-14 are analyzed and rejected as previously discussed with respect to claims 6-7.

Conclusion

10. THIS ACTION IS MADE FINAL. Applicant is reminded of the extension of time policy as set forth in 37 CFR 1.136(a).

A shortened statutory period for reply to this final action is set to expire THREE MONTHS from the mailing date of this action. In the event a first reply is filed within TWO MONTHS of the mailing date of this final action and the advisory action is not mailed until after the end of the THREE-MONTH shortened statutory period, then the shortened statutory period will expire on the date the advisory action is mailed, and any extension fee pursuant to 37 CFR 1.136(a) will be calculated from the mailing date of the advisory action. In no event,

Application/Control Number: 10/754,498 Page 10

Art Unit: 2622

however, will the statutory period for reply expire later than SIX MONTHS from the mailing date of this final action.

Any inquiry concerning this communication or earlier communications from the examiner should be directed to Carramah J. Quiett whose telephone number is (571) 272-7316. The examiner can normally be reached on 8:00-5:00 M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, NgocYen Vu can be reached on (571) 272-7320. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
